

PulseVet Focused Shockwave

Extra-corporeal Shock Wave Therapy - Our focal shock wave unit is currently being used at 19 practices over the UK and successfully being used for a number of ailments including:-

- Splint bone Fractures
- Suspensory ligament
- Kissing spines

- Collateral ligament injury
- Proximal suspensory
- Sacroiliac region
- Other back ailments

Case Studies

- Collateral ligament injury of the coffin joint - after sustaining the injury, the horse had received different forms of treatment without improvement. It was not until shockwave therapy was used that a significant improvement in posture and gait was recorded.
- Pedal bone fracture - recovery from a palmer wing fracture was initially very slow with rest only. A course of shockwave therapy was started, which significantly improved recovery.
- Desmitis of suspensory ligament branches - shockwave therapy was used alongside intramuscular injections and altered exercise regimes.
- Kissing spines - several cases have shown good success with shockwave therapy alone or in conjunction with steroid injections.

These case studies were provided by Emmanuel Engeli MRCVS

For further information please contact your local sales representative who will be more than happy to demonstrate the unit.
